Preschool HABIT-ILE

Helping kids with CP to improve their movement and independence in daily life

Kids with cerebral palsy can find it difficult to use their two hands together to do everyday activities. They can also have trouble with their gross motor skills and how they move around. We are testing an intensive type of therapy called Hand Arm Bimanual Intensive training Including Lower Extremity Training (HABIT-ILE) delivered by physiotherapists, occupational therapists and therapy students that helps kids to improve their motor skills and independence in daily life activities.

Do you have a child aged 2 to 5 years old with bilateral cerebral palsy (GMFCS II-IV) ?
Do you live in or near Brisbane, QLD?
Call or email us to find out if your child can participate in this research study!
